              fact: 'Hubble sees in ultraviolet, visible, and near-infrared light. Ultraviolet reveals hot young stars. Infrared pierces dust clouds. Visible shows what our eyes would see — if they were 100 times more powerful.',
            },
          },
        ],
      },
    ],
    comprehensionQuiz: [
      {
        question: 'What was wrong with Hubble primary mirror?',
        options: [
          'It was cracked during launch',
          'It was pointed in the wrong direction',
          'It was ground to the wrong shape — 2.2 micrometres too flat at the edge — causing spherical aberration',
          'It was too small to collect enough light',
        ],
        correctIndex: 2,
        explanation: 'Hubble 2.4-metre mirror was polished with extreme precision but to the wrong sha pe — a 2.2-micrometre error at the edge. This caused spherical aberration: different zones of t he mirror focused light at different distances, blurring every image.',
      },
      {
        question: 'Why can Hubble see more clearly than the best ground-based telescopes?',
        options: [
          'It is bigger than any ground telescope',
          'It uses a different colour of light',
          'It orbits above the atmosphere, avoiding the blurring effect of moving air',
          'It is closer to the stars',
        ],
        correctIndex: 2,
        explanation: 'Earth atmosphere scatters and absorbs light, blurring even the sharpest ground-b ased images. Above the atmosphere, Hubble also detects ultraviolet and infrared wavelengths tha t are blocked by the air below.',
      },
      {
        question: 'How did engineers fix Hubble mirror without bringing it back to Earth?',
        options: [
          'They replaced the entire primary mirror from the Shuttle',
          'They installed COSTAR — a set of small corrective mirrors that cancelled the shape error —
```

```
   ■ plus a new camera with the correction built in',
877 |           'They polished the existing mirror using robotic arms',
878 |           'They pointed the telescope at brighter objects to compensate',
879 |         ],
880 |         correctIndex: 1,
881 |         explanation: 'COSTAR contained tiny mirrors ground to introduce the exact opposite of Hubble a
   ■ berration, cancelling it optically. The Wide Field Planetary Camera 2 had the correction built
   ■ into its optics. Both were installed by spacewalking astronauts in December 1993.',

  1 | /**
  2 |  * tierEvents.ts — Progressive event deck for 5 difficulty tiers
  3 |  *
  4 |  * Each event exists in 5 variant versions sharing the same Sol timing
  5 |  * and physical outcome, but differing in:
  6 |  *   • Language complexity
  7 |  *   • Unit display (%, descriptive label, or SI unit)
  8 |  *   • Number of choices
  9 |  *   • Depth of consequence narrative
 10 |  *   • Scientific reference citation visibility
 11 |  *
 12 |  * ALL resource delta values are computed from the same verified constants
 13 |  * in scientificConstants.ts — they never change between tiers; only the
 14 |  * presentation layer changes.
 15 |  *
 16 |  * Scientific references are embedded as comments at the point of use.
